

⚠ Minor differences to be aware of

Feature cmd PowerShell

Virtual env activation `.venv\Scripts\activate` same

Set environment var `set VAR=value $env:VAR="value"`

List files `dir` `ls` or `dir`

Copy/paste Right-click or `Ctrl+C`/`Ctrl+V` (enable in properties) `Ctrl+Shift+C/V`

Command history `doskey /history` `Get-History` or up/down arrows

But for 99% of Django work, the commands are identical. The framework doesn't care which shell you use.

🎯 Core Goals of the Icon Grid

1. Zero reading, instant understanding

In a crisis, reading takes too long and can be confusing. Icons speak to everyone, regardless of language, age, or literacy. A flame means fire, a star of life means medical – no translation needed.

2. One-tap action

Each icon is a large, tappable button. No menus, no scrolling, no "are you sure?" The user taps the icon that matches what's happening, and the app immediately knows whether to call 911, 211, or trigger a specific emergency protocol.
